

Docket No. AUS920010291US1

CLAIMS:

What is claimed is:

5

1. A method in a data processing system for handling a situation, the method comprising:
 - responsive to detecting a situation, applying an
 - aging function to the situation; and
 - presenting alerts regarding the situation based on the aging function.
2. The method of claim 1, wherein the aging function is a decay function.
3. The method of claim 1, wherein the aging function includes a user settable threshold.
4. The method of claim 1, wherein the aging function is an increasing time function.
5. The method of claim 4, wherein the increasing time function is one of a linear function or an exponential function.
6. The method of claim 1, wherein the aging function is a decreasing function.
7. The method of claim 6, wherein the decreasing function is a half-life function.

8. The method of claim 1, wherein the presenting step comprises:

5 9. The method of claim 1, wherein the situation is one of a denial of server, a suspicious Web server request, or an unauthorized access of a server.

```
monitoring for events;
```

responsive to detecting an event, which triggers a situation, applying an aging function to the situation, and in the aging function is used to identify a severity

presenting an alert for the situation based on the severity of the situation identified by the aging function.

12. The method of claim 11, wherein the set of events form a denial of service attack.

A data processing system comprising:
a bus system;
a communications unit connected to the bus system;
a memory connected to the bus system, wherein the

30 memory includes a set of instructions; and

Docket No. AUS920010291US1

5 a processing unit connected to the bus system,
wherein the processing unit executes the set of
instructions to apply an aging function to the situation
in response to detecting a situation; and present alerts
regarding the situation based on the aging function.

14. A data processing system for handling a situation,
the data processing system comprising:
applying means, responsive to detecting a situation,
10 for applying an aging function to the situation; and
presenting means for presenting alerts regarding the
situation based on the aging function.

15 15. The data processing system of claim 14, wherein the
aging function is a decay function.

16. The data processing system of claim 14, wherein the
aging function includes a user settable threshold.

20 17. The data processing system of claim 14, wherein the
aging function is an increasing time function.

25 18. The data processing system of claim 17, wherein the
increasing time function is one of a linear function or
an exponential function.

19. The data processing system of claim 14, wherein the
aging function is a decreasing function.

30 20. The data processing system of claim 19, wherein the
decreasing function is a half-life function.

09942745-03001

Docket No. AUS920010291US1

21. The data processing system of claim 14, wherein the presenting means comprises:

means for displaying the alert on a console.

5 22. The data processing system of claim 14, wherein the situation is one of a denial of server, a suspicious Web server request, or an unauthorized access of a server.

10 23. A computer program product in a computer readable medium for handling a situation, the computer program product comprising:

first instructions, responsive to detecting a situation, for applying an aging function to the situation; and

15 second instructions for presenting alerts regarding the situation based on the aging function.
